

Tasks

1. Install GCC on your computer and verify the installation by running `gcc --version` in your terminal or command prompt.

A screenshot of a Windows PowerShell terminal window. The title bar reads "Windows PowerShell". The text inside the terminal shows the command `gcc --version` being executed. The output displays the GCC version as 6.3.0, installed from MinGW.org. It also includes copyright information for the Free Software Foundation, Inc., and a disclaimer stating that the software is provided without warranty. The prompt `PS C:\Users\anura>` is visible at the bottom of the terminal.

```
Windows PowerShell

```

2. Open VS Code or DevC++ and create a new file named `hello.c`. Write a C program that prints 'Hello, Instagram World!' to the console.

A screenshot of the Dev-C++ 5.11 IDE. The window title is "Untitled1 - Dev-C++ 5.11". The menu bar includes File, Edit, Search, View, Project, Execute, Tools, AStyle, Window, and Help. The toolbar contains various icons for file operations and execution. The file explorer on the left shows a file named "hello.c". The main editor area displays the following C code:

```
1 #include<stdio.h>
2
3 int main(){
4     printf("Hello, Instagram World!");
5 }
```

3. Identify and label the header, main function, and return statement in your hello.c program using comments.

The screenshot shows the Dev-C++ 5.11 IDE with a file named 'hello.c' open. The code is as follows:

```
1  #include<stdio.h>//header file
2
3  int main();//main function
4  {
5      printf("Hello, Instagram World!");
6      return 0;//return statement
7  }
```

The line numbers 1 through 7 are visible on the left margin. The code is color-coded: preprocessor directives and comments are in blue, function declarations are in green, and the main function body is in black. The return statement on line 6 is highlighted in light blue.

4. Compile your hello.c file using the GCC command line (`gcc hello.c -o hello`) and run the output file to display the message in your terminal.
Hint: On Windows, the output file will be `hello.exe`; on Linux/Mac, it will be `hello`.

The screenshot shows a Windows command prompt window with the following text:

```
C:\Windows\System32\cmd.e  x  +  v
Microsoft Windows [Version 10.0.26200.9168]
(c) Microsoft Corporation. All rights reserved.

A:\folder for codes\dsa>gcc hello.c -o hello

A:\folder for codes\dsa>hello.exe
Hello, Instagram World!
A:\folder for codes\dsa>|
```
